

Case report of a patient undergoing scleral buckle with endolaser

Antônio Murillo Fernandes Sales, Adriane Macêdo Feitosa, Marcella Franco de Almeida, Pedro Javier Yugar, Thiago Barros de Oliveira, Roberta Helena Picanço Browne de Oliveira, Mariana Melo Gontijo, André Jucá Machado

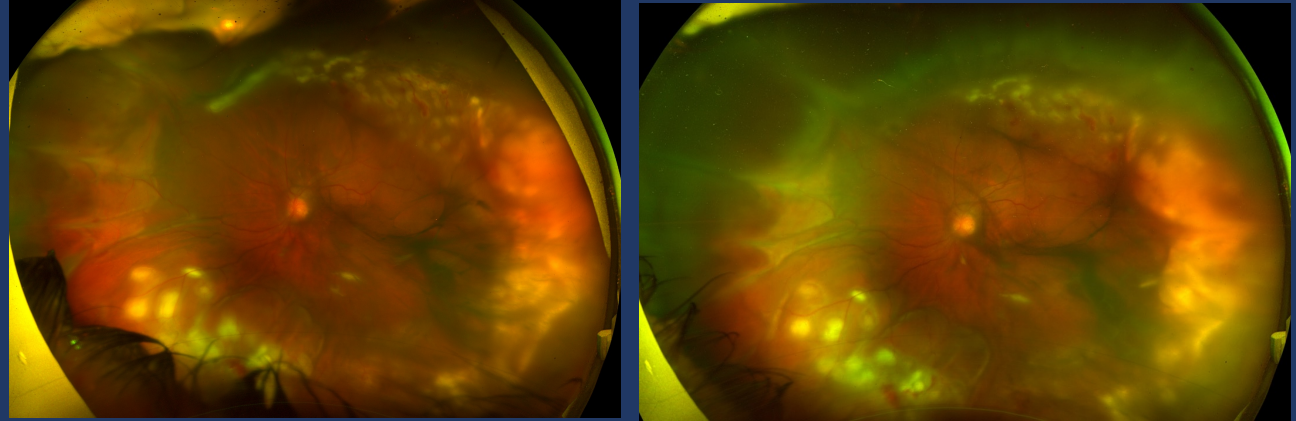

Clinical Case

- 44 year-old male
 - No medical history
- Sudden low visual acuity in left eye
 - BCVA: 20/20 in right eye and 20/400 in left eye
 - IOP and Biomicroscopy: normal
 - Retinography/Fundus Examination
 - OD: normal
 - Rhegmatogenous retinal detachment in the superior temporal region with areas of lattice degeneration, in addition to the presence of a single rupture OE

Management

- Scleral buckle and endolaser with a 25 gauge probe
- Post operative: developed vitriitis, hyperemia, chemosis associated with intense pain.

- Conduct: buckle was removed, showing improvement in pain complaints, inflammatory signs in the vitreous and important recovery of visual acuity in addition to applied retina.
